Lesson 4: The Area of Obtuse Triangles Using Height and Base

Classwork

Opening Exercises

Draw and label the height in each triangle below.

1. 

2. 

3. 

Exploratory Challenge

1. Use rectangle “x” and the triangle with the altitude inside (triangle “x”) to show the area formula for the triangle is \( A = \frac{1}{2} \times \text{base} \times \text{height} \).
   
   a. Step One: Find the area of rectangle x.

   b. Step Two: What is half the area of rectangle x?

   c. Step Three: Prove, by decomposing triangle x, that it is the same as half of rectangle x. Please glue your decomposed triangle onto a separate sheet of paper. Glue it next to rectangle x.
2. Use rectangle “y” and the triangle with a side that is the altitude (triangle “y”) to show the area formula for the triangle is \( A = \frac{1}{2} \times \text{base} \times \text{height} \).
   a. Step One: Find the area of rectangle y.
   
   b. Step Two: What is half the area of rectangle y?
   
   c. Step Three: Prove, by decomposing triangle y, that it is the same as half of rectangle y. Please glue your decomposed triangle onto a separate sheet of paper. Glue it next to rectangle y.

3. Use rectangle “z” and the triangle with the altitude outside (triangle “z”) to show the area formula for the triangle is \( A = \frac{1}{2} \times \text{base} \times \text{height} \).
   a. Step One: Find the area of rectangle z.
   
   b. Step Two: What is half the area of rectangle z?
   
   c. Step Three: Prove, by decomposing triangle z, that it is the same as half of rectangle z. Please glue your decomposed triangle onto a separate sheet of paper. Glue it next to rectangle z.

4. When finding the area of a triangle, does it matter where the altitude is located?

5. How can you determine which part of the triangle is the base and the height?
Exercises

Calculate the area of each triangle. Figures are not drawn to scale.

6. 

\[ \text{Area} = \frac{1}{2} \times 	ext{base} \times \text{height} \]

7. 

\[ \text{Area} = \frac{1}{2} \times 	ext{base} \times \text{height} \]

8. Draw three triangles (acute, right, and obtuse) that have the same area. Explain how you know they have the same area.
Problem Set

Calculate the area of each triangle below. Figures are not drawn to scale.

1. \[ \frac{1}{2} \times 15 \text{ in.} \times 17 \text{ in.} \\
\]

2. \[ \frac{1}{2} \times 72 \text{ m} \times 75 \text{ m} \\
\]

3. \[ \frac{1}{2} \times 21.9 \text{ km} \times 75.8 \text{ km} \\
\]

4. \[ \frac{1}{2} \times 12 \text{ m} \times 24 \text{ m} \\
\]

5. The Anderson’s were going on a long sailing trip during the summer. However, one of the sails on their sailboat ripped, and they have to replace it. The sail is pictured below.

If the sailboat sales are sail for $2 a square foot, how much will the new sail cost?
6. Darnell and Donovan are both trying to calculate the area of an obtuse triangle. Examine their calculations below.

\[
\begin{align*}
\text{Darnell's Work} & \quad \text{Donovan's Work} \\
A = \frac{1}{2} \times 3\text{ in.} \times 4\text{ in.} & \quad A = \frac{1}{2} \times 12\text{ in.} \times 4\text{ in.} \\
A = 6\text{ in}^2 & \quad A = 24\text{ in}^2
\end{align*}
\]

Which student calculated the area correctly? Explain why the other student is not correct.

7. Russell calculated the area of the triangle below. His work is shown.

\[
A = \frac{1}{2} \times 43\text{ cm} \times 7\text{ cm} \\
A = 150.5\text{ cm}^2
\]

Although Russell was told his work is correct, he had a hard time explaining why it is correct. Help Russell explain why his calculations are correct.

8. The larger triangle below has a base of 10.14 m; the gray triangle has an area of 40.325 m².

\[
\text{base of larger triangle} = 10.14\text{ m} \\
\text{area of gray triangle} = 40.325\text{ m}^2
\]

a. Determine the area of the larger triangle if it has a height of 12.2 m.

b. Let \( A \) be the area of the unshaded (white) triangle in square meters. Write and solve an equation to determine the value of \( A \), using the areas of the larger triangle and the gray triangle.
